

## **GE8292: ENGINEERING MECHANICS**

### **UNIT -1(BASICS & STATICS OF PARTICLES)**

#### **1. Define force?**

Force is a physical quantity that changes or tries to change the state of rest or of uniform motion of an object

#### **2. Differentiate between particles and rigid body?**

Particle is a body which has mass but no dimension where as rigid body as both mass and dimensions. Particle can have only translational motion where as rigid body can have translational as well as rotational motion.

#### **3. State newton's first law of motion?**

Everybody tries to be in it's state of rest or of uniform motion along a straight line unless it's acted upon by an external unbalanced force .

#### **4. State newton's second law of motion?**

The rate of change of momentum of a body is directly proportional to the applied force and takes place in the direction of the force .

#### **5. State newton's third law of motion?**

Every action has an equal and opposite reaction .

**6. State law of parallelogram of vectors?**

If two vectors are represented in magnitude and direction by two adjacent sides of a parallelogram, their resultant is represented in magnitude and direction by the diagonal of the parallelogram drawn from the common point.

**7. State the principle of transmissibility of force with simple sketch?**

According to principle of transmissibility of force, the force can be transmitted from one point to another on its line of action without causing any change in the motion of the object. EG: force F can be transmitted from A to B.

**8. Define unit vector?**

A vector having magnitude one unit is known as a unit vector.

**9. Define the following terms?**

(a) coplanar forces

(b) concurrent forces

(a) If all forces act in one plane, they are known as coplanar forces.

(b) If lines of action of all forces intersected at a single point, the forces are known as concurrent forces.

**10. Differentiate between collinear and concurrent forces?**

Collinear forces act along the same line whereas concurrent forces have lines of action intersecting at one point.

**11. Define resultant of coplanar concurrent force system?**

A system of coplanar concurrent forces can be reduced to a single force which is known as resultant force.

**17. State triangle law of equilibrium?**

**12. what is the difference between a resultant force and equilibrant force?**

Resultant force makes the object move whereas equilibrant force keeps it in equilibrium.

**13. state triangle law of forces?**

If two forces are represented in magnitude and direction by two sides of a triangle taken in order, their resultant is represented in magnitude and direction by the third side of the triangle drawn from starting point of first force to end point of the second force.

**14. State parallelogram law of forces?**

If two forces are represented in magnitude and direction by two adjacent sides of a parallelogram, their resultant is represented in magnitude and direction by the diagonal of the parallelogram drawn from the common point.

**15. State Lami's theorem?**

If three concurrent forces are in equilibrium, magnitude of any force is proportional to the sine of angle between the other two forces.

**16. State the necessary and sufficient condition for static equilibrium of a particle in two dimensions?**

For static equilibrium of a particle in two dimensions,

i) The algebraic sum of horizontal components of all forces acting the particle must be zero.

ii) The algebraic sum of vertical components of all forces acting the particle must be zero.

If three forces acting on a particle are represented by the three sides of a triangle in magnitude and direction when taken in order, the particle will remain in equilibrium.

### **18. What is a free body diagram?**

A force system, in a plane, in which the lines of action of all forces intersect at a single point is called a coplanar concurrent force system.

## **UNIT- 2(EQUILIBRIUM OF RIGID BODIES)**

### **1. State Varignon's theorem?**

The algebraic sum of moments due to all forces acting on the object about any point is equal to the moment of their resultant about the same point.

### **2. Define couple?**

Two non-collinear parallel forces having the same magnitude but opposite directions form a couple.

### **3. Why is the couple moment said to be a free vector?**

Couple moment is said to be a free vector as it can be transferred to any point in the plane without causing any change in its effect on the body.

### **4. Distinguish between couple and moment?**

Moment represents the turning effect of a force, whereas a couple consists of two equal and opposite forces separated by some distance. The moment of a force varies from point to point, but the moment of a couple is the same about any point in the plane.

### **5.What is meant by force-couple system?**

A system of coplanar non concurrent force system acting in a rigid body can be replaced by a single resultant force and couple moment at a point known as force couple system.

### **6.Can a coplanar non concurrent system with zero resultant force necessarily be in equilibrium?**

A coplanar non concurrent system with zero resultant force is not necessarily in equilibrium as it can have a non zero resultant moment.

### **7.When is moment of force zero about a point?**

The moment of force about a point is zero its line of action passes through that point.

### **8.When is moment of force maximum about a point ?**

Moment of force is maximum about a point when,

- i)Its applied at maximum result from the point and,
- ii)It is applied perpendicular to the line joining the point to the point of application of force.

### **9.When is moment of force zero about a line?**

Moment of force about a line is zero when,

- i)Force is parallel to that line or,
- ii)Line of action of force intersects that line.

**10.Explain free body diagram with one example?**

Free body diagram is the isolated diagram of an object\system of objects\any point in the system in which all forces at couple moment acting on it are shown including support reactions example:consider a ladder of weight W having rollers at it's end's as shown in figure.

**11.Statethe necessary and sufficient conditions for equilibrium of rigid bodies in two dimensions?**

The necessary and sufficient conditions for equilibrium of rigid bodies in two dimensions are:

- 1)algebraic sum of horizontal components of all forces acting on the body is must be zero,
- 2)Algebraic sum of vertical components all forces acting on the body is must be zero,
- 3)Algebraic sum of moments due to all forces and couple moments acting the body is in must be zero.

**12.Write the equation of equilibrium of a rigid body?**

The three equations of a rigid body are:

$$\sum F_x=0,;$$

$$\sum F_y=0,;$$

$$\sum M=0.$$

**13. Write the conditions equilibrium of a system of parallel force acting in a plane ?**

The two conditions of equilibrium of a system of parallel forces acting in a plane are :

- 1) Algebraic sum of all forces must be zero,
- 2) Algebraic sum of moments due to all forces about any point must be zero.

**14. What are the reactions at a fixed support of a plane beam that are possible?**

The reaction at fixed support of a plane beam consist of ,

- 1) A reaction force in the plane which can be represented by its two components (Generally taken to be horizontal and vertical) &
- 2) A reaction moment.

**15. How many scalar equations can be obtained for equilibrium of rigid body in three dimensions?**

Six scalar equations can be obtained for equilibrium of a rigid body in three dimensions.

## **UNIT- 3(PROPERTIES OF SURFACES AND SOLIDS)**

### **1. Define centroid of gravity.**

Centroid is the geometrical center of the body whereas center of gravity is the point through which weight of the body acts.

### **2. Define first moment of an area about of an axis.**

The first moment of an area about of an axis is the product of an area and the perpendicular distance of its centroid from axis.

### **3. Define line of symmetry.**

Line of symmetry is line a about which the area on one side is a mirror image of the area of the side

### **4. State pappus-guldinus theorem for finding surface area.**

The area of surface of revolution is equal to the product of the length of the generating curve and the distance travelled by the centroid of the generating curve while generating that surface.

### **5.What is uniform motion.**

If the velocity of body does not change with time ,then the motion is called as uniform motion.

### **6.state parallel axis theorem.**

Moment of inertia of an area about an axis is equal to the sum of (a) moment of inertia an axis passing through the centroid parallel to the given axis and (b) the product of area and square of the distance between the two parallel axes.

### **7.Define principal axes and principal moment of inertia.**

The axes about which moments or inertia is maximum and minimum are known as principal axes .when these two axes are passing through centroid of aera it is known a centroidal principal axis.now the maximum and minimum moments of inertia are called principal moments of inertia.

Kinematics refers to the study of bodies in motion without considering the force that causes motion.

### **7. Define Dynamics.**

Dynamics is the branch of mechanics which deals with the analysis of particles and bodies in motion.

## **UNIT- 5(FRICTION AND ELEMENTS OF RIGID BODY DYNAMICS)**

### **1. Define instantaneous centre of rotation.**

Instantaneous centre of rotation is a point identified with in a body where the velocity is zero.

### **2. Define co-efficient of restitution.**

It is ratio of magnitudes of impulses corresponding to the period of restitution and to the period of deformation is called coefficient of restitution .

### **3. Define kinetics.**

Study of bodies subjected to forces which are unbalanced is called kinetics.

### **4. Define kinematics**

The study of geometry and time dependent aspects of motion without considering forces causing motion.

### **5. Define Angular momentum.**

Momentum of linear momentum is called angular momentum.

**6.what is general plane motion ? give some examples.**

When motion of particles and rigid bodies defined in a plane is called plane motion.

Example :All planets revolving around the sun.

**7.Define Relative velocity.**

Assume particle A moves with a velocity of  $V_a$  and particle B moves with a velocity  $V_b$ .

**8.Define Resultant velocity.**

Assume particle A moves to x direction  $V_x$  and in y direction  $V_y$  this resultant velocity.

**9.How will you calculate the linear restoring force of an elastic material.**

Linear restoring force of an elastic material.

$$F=kx$$

Where k is the stiffness of the material and x is the displacement.

**10.state the principle of work and energy.**

The principle of work and energy or work energy equation is written as  
Work done =final kinetic energy - initial kinetic energy

**11.Define instantaneous centre of rotation.**

A rigid body in plane motion can be considered to rotate about a point that remains at a particular instant. This point having zero instantaneous velocity is called the instantaneous centre of rotation.
